

# Using open geospatial data and technology to support malaria risk modelling

Malaria Atlas Project: Data Engineering Team

# Who we are

## Malaria Atlas Project

A geospatial disease modelling research group. Focussed primarily on malaria

### *Why malaria?*

- Responsible for an estimated 640,000 deaths in 2019
- Disproportionally affects sub-Saharan Africa and kills children under 5

### *Mission*

- Improve understanding of global malaria risk and the impact of interventions
- Disseminate free, accurate and up-to-date geographical information on malaria
- Provide policy makers with information on trends and on which interventions are most effective
- Reduce malaria morbidity and mortality by facilitating targeting of resources

# Who we are

## Data Engineering Team

Support modelling work by building and using software tools across three core areas:

1. **Data acquisition**

Identification and ingestion of new datasets relevant to malaria

2. **Data processing**

Extraction of useful information into a consistent format

3. **Data dissemination**

Publication of input and output datasets on the web

# Data Sources

## Administrative unit boundaries:

- GADM, GAUL, **country ministries of health**

## Routine surveillance: data associated with administrative units (polygons)

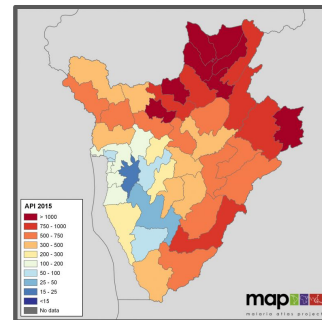

- MoH reports/websites, WHO reports, **privately shared MoH reports**

## Parasite Rate and Interventions: data associated with survey locations (points)

- Surveys from academic lit. reviews, **DHS Surveys, MICS surveys, SPA Surveys**

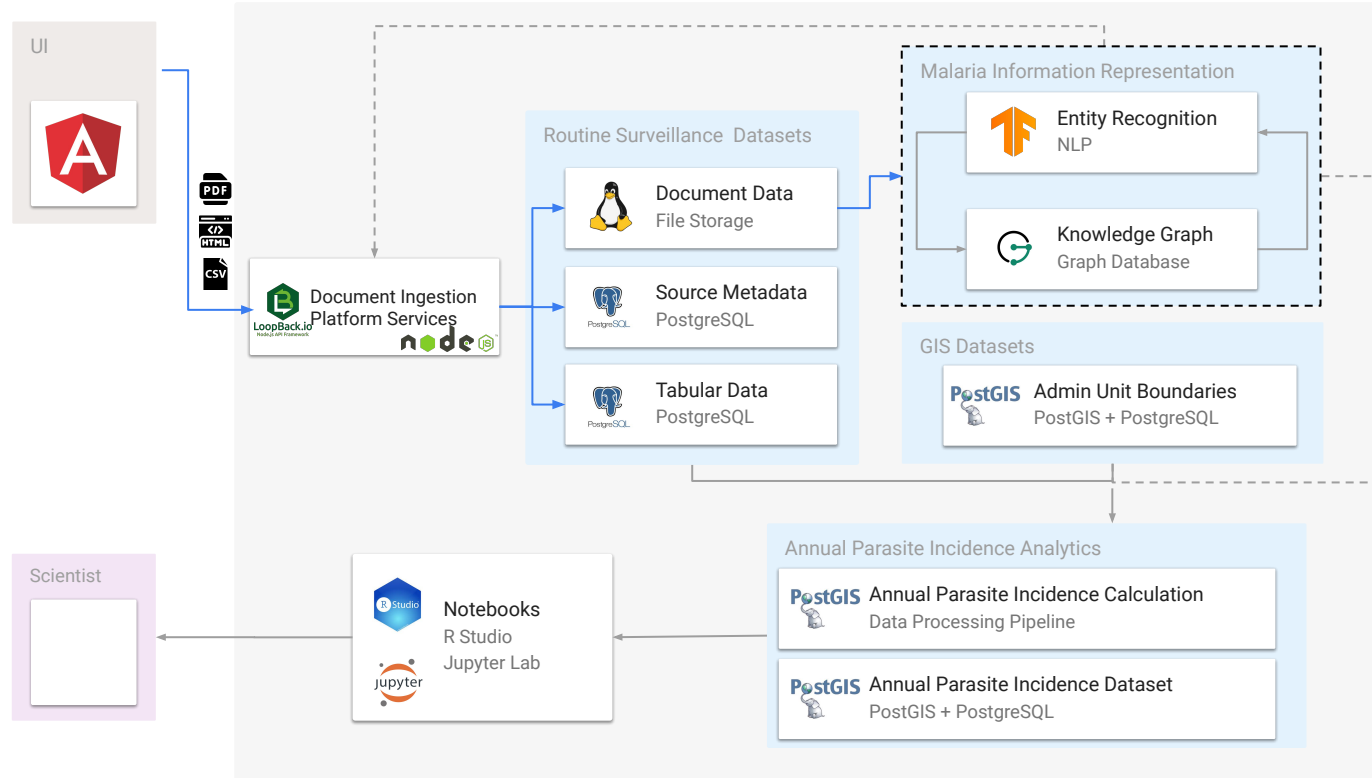

## Satellite imagery: environmental data

- NASA MODIS data; other publicly available satellite data
